The Baltic+ Sea Level (BALTIC SEAL) – Motivation

What?

- Generation of a novel multi-mission sea level (MMSL) along-track and gridded product

Why?

- Previous products do not include information from the sea-ice covered surface and from the coastal zone
- Improvements in algorithms (classification, retracking), geophysical adjustments and corrections, radar techniques (Delay-Doppler Altimetry)
- Perfect laboratory for Satellite Altimetry (challenging coastlines, sea-ice coverage, small scale variability)

- Motivation and key development steps
- Results 1: a new regional mean sea surface
- Results 2: trends and variability analysis (from monthly gridded product)
- Results 3: an experimental high temporal resolution grid
- The way forward

3-days experimental gridded product

- Combination of 3-days of altimetry along-track observations (SAT 3-day), with 3-day-mean of tide gauges (circles) to generate blended gridded products (HR FGModel, HR FGSat)

3-day period: 1st of January to 3rd of January (2017)

3-days experimental gridded product

- A potential use of this HR product is to improve through observations the preconditions for storm surge simulations before extreme sea level events.

Table of Content

- Motivation and key development steps
- Results 1: a new regional mean sea surface
- Results 2: trends and variability analysis (from monthly gridded product)
- Results 3: an experimental high temporal resolution grid

Where do we go from here? The „Baltic Sea Lab“ ...

- 1) **Synergies:** multi-variable observation of Atlantic Inflow and recirculation within the Baltic Sea (using salinity and temperature dataset)
- 2) Synergies: increase the performances of **Vertical Land Motion** estimation by Tide Gauge-Altometry, perfect validation set up thanks to extensive GNSS network and the geodetic SAR technique
- 3) **Wave Height** climate, variability, trends and extremes: latest wave height data based on advanced altimetry processing show significant progresses in the coastal zone, and abatement of the measurement noise and wave spectral variability. The Baltic Sea shall „host“ both exploitation work and research on further improvements!
- 4) Advanced **coastal altimetry grids:** Baltic+ SEAL first attempt to produce them. Further studies shall investigate: irregular capsizes, covariance based on external dataset, integration/validation for SWOT
- 5) **Export best practice** to other regions with complex coastlines and/or partial sea-ice coverage

Thank you and Acknowledgment

These developments were produced by [a multi-disciplinary team](#) spanning four countries – the Technical University of Munich (DE), the Technical University of Denmark’s Space Institute (DK), the Finnish Meteorological Institute (FI), the Danish Meteorological Institute (DK), and University College Cork (IE). This collaboration was overseen, and supported by ESA under the Baltic+ element of the European Space Agency’s Earth Observation Envelope Programme 5 (EOEP5) Regional Initiative. It arose in direct response to major discussion points gathered during the “[Baltic from Space Workshop](#)” hosted by FMI in Helsinki in March, 2017.

Thank you for reading and listening!

More Information

Product download and documentation is available via the Baltic SEAL website. This includes the requirements analysis, validation reports, algorithm theoretical basis documents, and impact assessment reports. The scientific roadmap is also made available, charting a course forward for the various scientific advances made by the Baltic SEAL team.

The Product Handbook describing the dataset is:

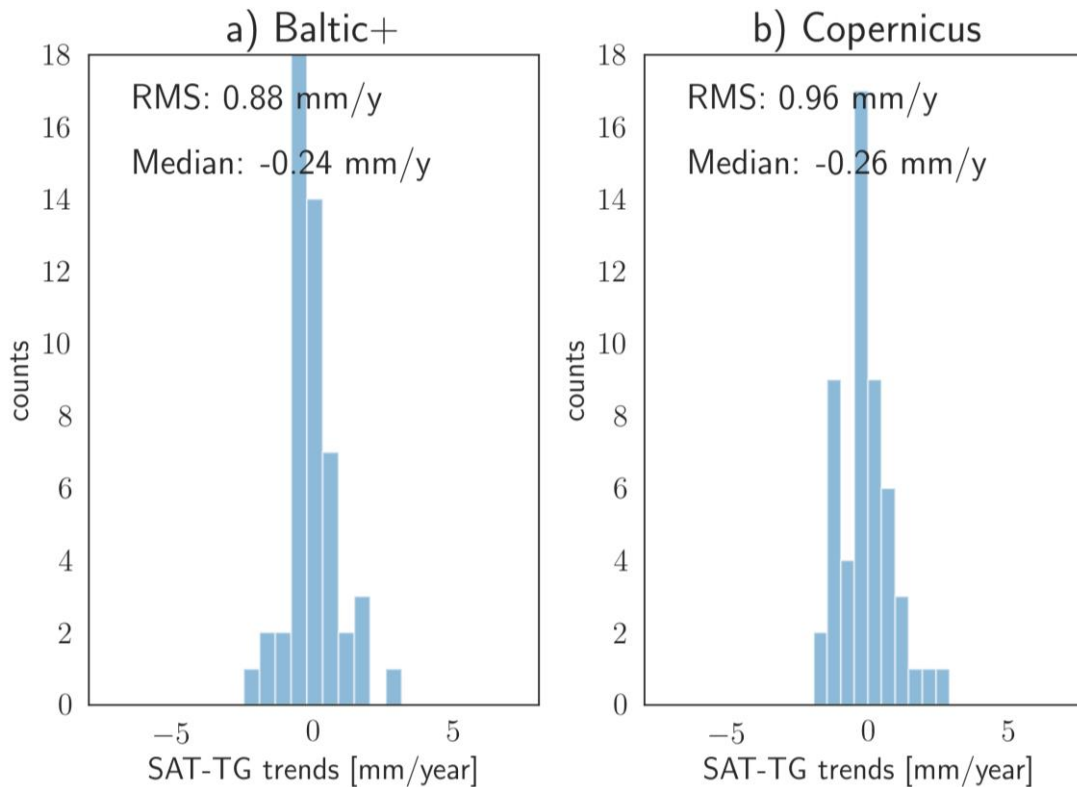

Passaro, M., Müller, F., Dettmering, D., Abulaitjiang, A., Rautiainen, L., Scarrott, R.G., Chalençon, E., Sweeney, M., (2021). Baltic SEAL: Product Handbook, Version 1.1. Report delivered under the BalticSEAL project (ESA contract no. 000126590/19/I/BG). DOI: <http://doi.org/10.5270/esa.BalticSEAL.PH1.1>
